

Abstract of the Disclosure

The present invention describes a highly versatile and effective facial composition containing two very simple human endogenous compounds, glycerin or any other nonvolatile, pharmacologically acceptable, slowly absorbed, water-miscible, liquid organic substance and water, which, when applied topically to facial skin in high concentrations, is surprisingly effective for achieving facial skin improvements. The effect of cosmetic improvements lasts up to 24 hours after one single application of the composition. The novel, transparent or semi-transparent, unconventional aqueous composition is especially useful for postmenopausal women.
